Category:Rhythm and blues discographies Category:Corea, ChickQ: Plotting multiple lines and x-values I have a list of patients with ID, age and some further information (variable in the plot, one row per patient) and want to plot age and p-value of a t-test as a line per patient. So far I have: p %
#make sure it contains only valid points filter(p >= -2.5 & p % #only keep the continuous variables
(I want the age and p-value) select(-p, -age) %>% #reverse the order of the data mutate(age =
age[order(ID)], p = p[order(ID)]) ggplot(p, aes(x = age, y = p)) + geom_point(aes(colour = ID)) +
geom_line(aes(colour = ID)) This gives me a nice plot, but it
