What are the benefits of using public key cryptography? The typical use of public key cryptography is for the purpose of signing data. A signature is used to bind an identity and a message together. The recipient can verify the signature, and check the provenance of the message as it was signed by the given identity. Public key cryptography allows the message sender to be completely anonymous. The sender can encrypt a message to anyone, and only the intended recipient can decrypt the message. Public key cryptography is used for digital signatures because: It is secure It is anonymous and trustless. No middleman is needed You don't need a trusted third party. What is a PGP public key? A key pair consists of a private key and a public key. They are used to secure communication between two users. Before any two users can communicate securely, they must generate a key pair. Why use public key cryptography? With public key cryptography, you can encrypt a message that will be safe from anyone else, but you cannot decrypt it unless you have the private key. Because the private key cannot be used to decrypt the message, the sender's identity is concealed and cannot be determined. This allows you to send a message, which you can later decrypt. When used with a certificate, this is called digital signature. PGP is the most commonly used public key cryptography, but other systems exist. Other public key systems include: DSA (Digital Signature Algorithm) ECDSA (Elliptic Curve Digital Signature Algorithm) ElGamal RSA (Rivest-Shamir-Adelman) When you have a key pair, you have the following options:
